BLI LEGAL TECH HACKATHON 2 · CHAINLINK CRE · ROBINHOOD CHAIN

A CITATION CHECK FOR AI-WRITTEN RESEARCH.

Courts have logged 1,116 US filings with AI-fabricated content. Research is drafted by the same models. Vouch checks every figure against the SEC filing, through a Chainlink CRE workflow.

EXHIBIT 6, IN TWENTY SECONDS

AN AI GOT THE QUARTER WRONG. IT PAID, AND THE TRADE WAS REFUSED.

EXHIBIT 6 TSLA

THE AI WROTE	**Depreciation for Q3 2026 was $1.37 billion.**
THE 10-Q SAYS	Depreciation expense during the three and six months ended June 30, 2026 was $1.37 billion and $2.71 billion, respectively.
STAKE	25 test USDG to the readers' fund
TRADING AGENT	its order citing exhibit 6 reverted on-chain

SLASHED
WRONG QUARTER

WHERE IT RAN Robinhood Chain testnet, settled by the Chainlink CRE workflow in the CRE CLI simulation: 50 of 50 verdicts, 18 cleared, 32 slashed (market 0x3234bd…3E1a33).

THE LEGAL GAP

RESEARCH RULES ASSUME A PERSON. AI DRAFTS RESEARCH NOW.

REGULATION AC · 17 CFR 242.501(A)(1)

“all of the views expressed … accurately reflect the research analyst's personal views”

FINRA RULE 2241(C)(1)(A)

“purported facts in its research reports are based on reliable information”

FINRA REGULATORY NOTICE 24-09

“FINRA's rules are intended to be technology neutral”

FINRA 2026 OVERSIGHT REPORT · AI AGENTS

“how to track agent actions and decisions”

COURTS ALREADY KNOW THE FAILURE 1,116 US court filings with AI-fabricated content, 1,600 worldwide (Charlotin database, reported by AFP, June 2026).

HOW IT WORKS

WHAT WAS SAID, WHAT THE FILING SAYS, WHAT WAS DONE.

1

STAKE

An analyst, human or AI, posts one figure and the 10-Q sentence behind it, with a stake.

2

CHECK

A Chainlink CRE workflow fetches the filing from SEC EDGAR and runs the check.

3

PAY

Wrong: the stake goes to a readers' fund fixed at deploy. Right: it comes back.

4

GATE

A trading agent cannot cite a claim that failed. The trade reverts.

5

RECORD

Each trade keeps its exhibits, verdicts and reasons, hashed on-chain.

CHAINLINK RUNTIME ENVIRONMENT

THE CHECK IS A CRE WORKFLOW. THE CONTRACT HAS NO VERIFIER KEY.

Posted event → log trigger → HTTP: SEC EDGAR → the check → identical consensus → report → **forwarder** → **BondedClaims.onReport** (owner, name, pinned workflow id, claim hash)

3,249

claims on five real 10-Qs: the same verdict on Bun and QuickJS as the Python check

50/50

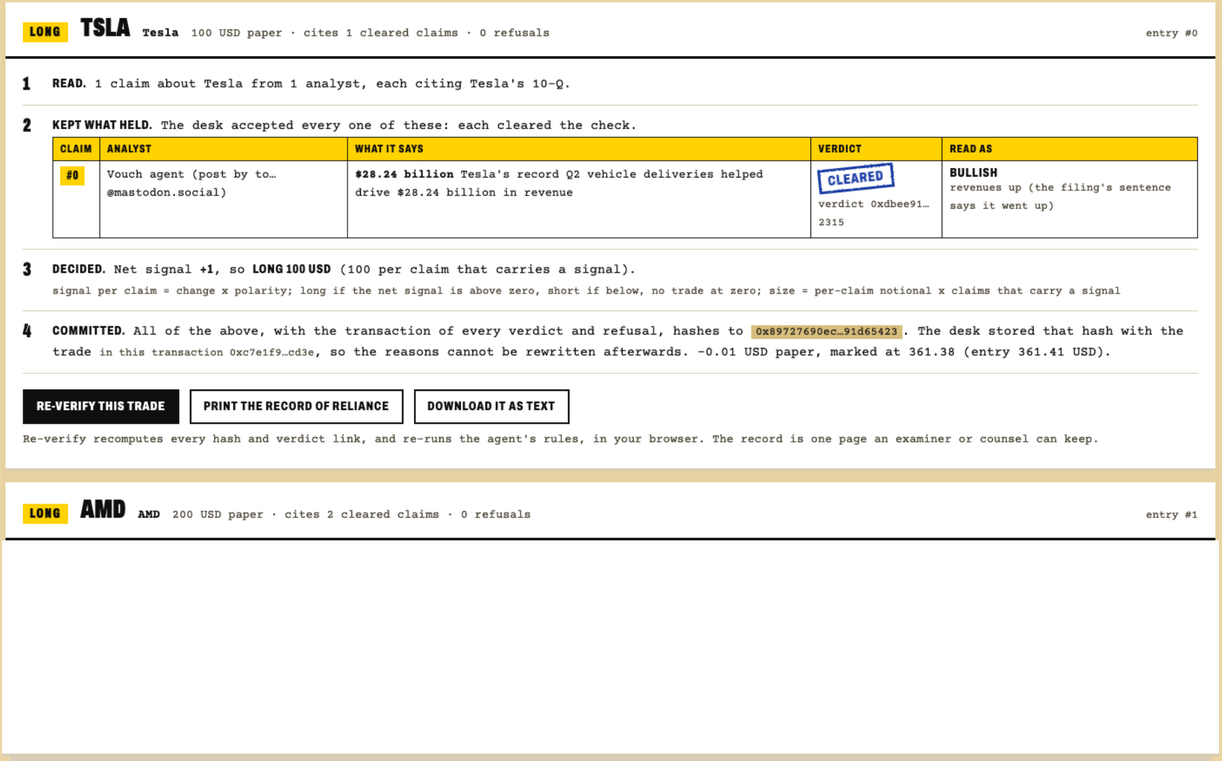

verdicts written on Robinhood Chain testnet by the CRE workflow in the CRE CLI simulation

0

verifier keys in the contract

RAN cre workflow build, the SDK test runtime, QuickJS parity, the testnet posting. **NOT YET** the CRE CLI simulation (needs the CRE login) and a live DON. In simulation, Chainlink's mock forwarder takes anyone's report.

EVERY TRADE KEEPS ITS REASONS. RE-VERIFY REDOES THEM.

LONG **TSLA** Tesla 100 USD paper · cites 1 cleared claims · 0 refusals — entry #0

1 **READ.** 1 claim about Tesla from 1 analyst, each citing Tesla's 10-Q.

2 **KEPT WHAT HELD.** The desk accepted every one of these: each cleared the check.

CLAIM	ANALYST	WHAT IT SAYS	VERDICT	READ AS
#0	Vouch agent (post by to… @mastodon.social)	**$28.24 billion** Tesla's record Q2 vehicle deliveries helped drive $28.24 billion in revenue	CLEARED verdict 0xdbee91… 2315	**BULLISH** revenues up (the filing's sentence says it went up)

3 **DECIDED.** Net signal **+1**, so **LONG 100 USD** (100 per claim that carries a signal).
signal per claim = change x polarity; long if the net signal is above zero, short if below, no trade at zero; size = per-claim notional x claims that carry a signal

4 **COMMITTED.** All of the above, with the transaction of every verdict and refusal, hashes to `0x89727690ec…91d65423`. The desk stored that hash with the trade in this transaction 0xc7e1f9…cd3e, so the reasons cannot be rewritten afterwards. -0.01 USD paper, marked at 361.38 (entry 361.41 USD).

RE-VERIFY THIS TRADE | PRINT THE RECORD OF RELIANCE | DOWNLOAD IT AS TEXT

Re-verify recomputes every hash and verdict link, and re-runs the agent's rules, in your browser. The record is one page an examiner or counsel can keep.

LONG **AMD** AMD 200 USD paper · cites 2 cleared claims · 0 refusals — entry #1

News checker. The agent read 130 real public posts. Claude Haiku 4.5 judged 16 to state a checkable figure; the agent staked on the 3 a filing sentence states. All 3 held.

Each model reply is hashed into the record. A refused claim cannot move a trade.

FOR LAWYERS

WHAT THE RECORD PROVES, AND WHAT IT DOES NOT.

IT PROVES

- ✓ the exact words of each claim, who staked, when
- ✓ which filing bytes were checked, by which workflow
- ✓ that a trade cited only claims that cleared
- ✓ that its reasons were fixed when it was made

IT DOES NOT PROVE

- ✗ that a view was honestly held (Reg AC)
- ✗ a reasonable basis (2241(c)(1)(B))
- ✗ that the filing is true, or the claim complete
- ✗ who is behind a wallet, or Rule 17a-4

WHO USES IT

EVIDENCE FOR THE PEOPLE WHO ANSWER FOR RESEARCH.

COMPLIANCE

PUBLISH ONLY CLEARED

Keep the check's record for each fact: evidence of 2241(c)(1)(A) procedures.

PUBLISHERS

SHOW THE WORK

Per claim, proof the numbers were checked, with a stake behind them.

AGENT OPERATORS

GUARDRAIL AND TRACE

The desk is the guardrail; the record of reliance is the trace.

EXAMINERS, COURTS

RE-RUN IT

An independent record anyone can redo from the filing.

PROOF IT WORKS

TESTED END TO END, ON REAL SEC FILINGS.

57

Foundry tests: forwarder-only verdicts, the readers' fund, forged workflows refused, money conserved

100

Python and Bun tests: rounds on a real EVM, the model paths, the journal tamper-checked, real posts

44/44

journal checks hold in the real-post round read by Claude Haiku 4.5

TRUST, STATED PLAINLY

WHAT IS TRUSTED TODAY, AND WHAT IS NEXT.

TODAY

- ✓ Simulation writes through a mock forwarder: it proves the path, not the security
- ✓ The filing is what SEC EDGAR serves; its hash is on-chain
- ✓ The check reads sentences, not tables, and says so

NEXT

- ✓ A live DON and a pinned workflow id
- ✓ Robinhood Chain mainnet, bonded in USDG
- ✓ One compliance team piloting cleared-only publication

IF IT'S WRONG, IT COSTS YOU. IF YOU TRADE ON IT, THE RECORD SHOWS WHY.
