BLI LEGAL TECH HACKATHON 2 · CHAINLINK CRE · ROBINHOOD CHAIN

Accountability for AI-written research.

Every claim checked by Chainlink against the company's SEC filing. A wrong claim costs its author. A trading agent can only act on what held, and every trade shows its receipts.

An AI got the quarter wrong. It paid, and the trading agent was refused, on-chain.

THE AI WROTE	Depreciation for Q3 2026 was $1.37 billion. *(about Tesla)*
THE 10-Q SAYS	Depreciation expense during the three and six months ended June 30, 2026 was $1.37 billion and $2.71 billion, respectively.
CHAINLINK CRE	wrong quarter: the period ended in June, the claim says Q3 2026 → −25 USDG
AGENTDESK	a trade citing it: reverted, naming the claim. The journal records why the agent traded what it did instead.

THE LEGAL GAP

Research rules assume a person. AI drafts research now, and cannot certify a belief.

REGULATION AC · 17 CFR 242.501(A)(1)

a certification "attesting that all of the views expressed in the research report accurately reflect the research analyst's personal views". The analyst: "any natural person..." (242.500)

FINRA RULE 2241(C)(1)(A)

procedures "reasonably designed to ensure that purported facts in its research reports are based on reliable information"

FINRA REGULATORY NOTICE 24-09

FINRA's rules "are intended to be technology neutral" and "continue to apply when member firms use Gen AI"

FINRA 2026 OVERSIGHT REPORT · AI AGENTS

consider "how to track agent actions and decisions; or how to establish guardrails"

HOW IT WORKS

A record of what was said, what the filing says, and what was done about it.

01

Stake

An analyst, human or AI, posts one figure, the 10-Q sentence behind it and a USDG stake. The exact words go on-chain.

02

Check

A Chainlink CRE workflow fetches the filing from SEC EDGAR on every node and runs the check. No verifier key.

03

Pay

Wrong: the stake goes to a pool that backs readers, in the same transaction as the verdict. Right: it comes back.

04

Gate

A trading agent cannot cite research that failed. The trade reverts, naming the claim.

05

Journal

Each trade keeps the claims it cites, the verdict on each and the agent's reasoning, hashed on-chain.

CHAINLINK RUNTIME ENVIRONMENT

The check runs on a Chainlink DON. The contract takes verdicts from nowhere else.

`Posted` event → EVM log trigger → HTTP: SEC EDGAR (gzip, ~100 KB) → the check on every node → identical consensus → signed report → `forwarder` → `BondedClaims.onReport`: owner, name, pinned workflow id, claim hash

3,249

claims on five real 10-Qs: same verdict, reason and score as the Python check, on Bun and on QuickJS (the engine CRE runs)

0

keys that can settle a dispute. One compiled workflow id can be pinned, forever

7 s

per claim on QuickJS, under 32 MB of WASM memory (limits: 5 min, 100 MB)

Every trade keeps its reasons. Re-verify redoes them in the browser.

SHORT **AMZN** Amazon 200 USD paper · cites 2 cleared claims · 6 refusals entry #0

01 **Read.** 8 claims about Amazon from 4 analysts, each citing Amazon's 10-Q.

02 **Refused.** It tried to trade citing everything it read. The desk asked Vouch about each claim and reverted the trade 6 times, each time naming a claim that failed the check:

#9 Misreader claims another number refused on-chain 0x4441f9…c989

#10 Embellisher quote was altered refused on-chain 0x400e12…4f84

#11 Fabricator not in the filing refused on-chain 0x7efa5e…7287

#13 Misreader claims another number refused on-chain 0xf86ac8…a467

#14 Embellisher a figure was changed refused on-chain 0x18606b…faa4

#15 Fabricator quote was altered refused on-chain 0x34ac02…cf68

03 **Kept what held.** The desk accepted every one of these: each cleared the check.

CLAIM	ANALYST	WHAT IT SAYS	VERDICT	READ AS
#8	Diligent	**$293 million** Changes in foreign exchange rates did not significantly impact sales and marketing costs for Q2 2026, …	CLEARED verdict 0x8e7979…373b	bearish costs up (the filing's sentence says it went up)
#12	Diligent	**$427 million** Changes in foreign exchange rates did not significantly impact technology and infrastructure costs for…	CLEARED verdict 0x2406cf…ea5e	bearish costs up (the filing's sentence says it went up)

04 **Decided.** Net signal **-2**, so **SHORT 200 USD** (100 per claim that carries a signal).

signal per claim = change x polarity; long if the net signal is above zero, short if below, no trade at zero; size = per-claim notional x claims that carry a signal

05 **Committed.** All of the above, with the transaction of every verdict and refusal, hashes to **0x8ebf0079ec…b011a9d6**. The desk stored that hash with the trade in this transaction 0x7520f2…7479, so the reasons cannot be rewritten afterwards. **+0.08 USD** paper, marked at 259.58 (entry 259.69 USD).

Re-verify this trade | Download the audit record — Recomputes every hash and verdict link, and re-runs the agent's rules, in your browser. The record is one file an examiner or counsel can keep.

- ✓ The reasoning record hashes to **0x8ebf0079…11a9d6**, the hash the trade carries.
- ✓ Claim #8: its words hash to the hash staked on-chain.
- ✓ Claim #8: cleared by the check against Amazon's 10-Q, in the verdict transaction cited.
- ✓ Claim #12: its words hash to the hash staked on-chain.
- ✓ Claim #12: cleared by the check against Amazon's 10-Q, in the verdict transaction cited.

FOR LAWYERS

What the record proves, and what it does not.

IT PROVES

- the exact words of each claim, who staked on them, when
- which filing bytes the verdict was checked against, and by which workflow
- that a trade cited only claims that had cleared
- that its stated reasons were fixed when it was made

IT DOES NOT PROVE

- that a view was honestly held (Reg AC's certification)
- a reasonable basis for a rating or target (2241(c)(1)(B))
- that the filing is true, or the claim complete
- who is behind a wallet, or Rule 17a-4 compliance

WHO USES IT

Evidence for the people who answer for research.

Compliance

Publish only cleared

A firm distributing AI-drafted or third-party research keeps the check's record for each fact: evidence of its 2241(c)(1)(A) procedures.

Publishers

Show the work

A newsletter that drafts with AI shows, per claim, that the numbers were checked, with a stake behind them.

Agent operators

Guardrail and trace

The desk is the guardrail, the journal the trace: the two things FINRA's 2026 report asks about AI agents.

Examiners, courts

Re-run it

An independent record of what was said, what the source said and what was done, that anyone can redo.

PROOF IT WORKS

Tested end to end, on real SEC filings.

41

Foundry tests: forwarder-only verdicts, forged workflow refused, money conserved through fuzzed disputes, unchecked claims refused by the desk

56

Python and Bun tests: a round on a real EVM, the journal re-verified and tamper-checked, the CRE handler in the SDK's test runtime

104/104

journal checks hold: nothing left out, record hashes, claim words, verdict transactions, filing bytes from EDGAR, a fresh check, the agent's rules re-run

TRUST, STATED PLAINLY

What is trusted today, and what is next.

TODAY

- Simulation writes through Chainlink's mock forwarder: it proves the path, not the security
- The filing is what SEC EDGAR serves; its hash is on-chain
- The check says what it cannot do: a limit versus a balance

NEXT

- A live DON, the KeystoneForwarder, a pinned workflow id
- Robinhood Chain mainnet, bonded in USDG
- 8-Ks and 10-Ks; one compliance team piloting cleared-only publication

If it's wrong, it costs you. If you trade on it, the record shows why.
