BLI LEGAL TECH HACKATHON 2 · CHAINLINK CRE · ROBINHOOD CHAIN

A citation check for AI-written research.

Courts have logged 1,116 US filings with AI-fabricated content (1,600 worldwide). Research is drafted by the same models. Here, every figure is checked against the SEC filing by a Chainlink CRE workflow, a wrong claim costs its author, and a trading agent can only act on what held.

TWENTY SECONDS

An AI got the quarter wrong. It paid, and the trading agent was refused, on-chain.

THE AI WROTE	Depreciation for Q3 2026 was $1.37 billion. *(about Tesla)*
THE 10-Q SAYS	Depreciation expense during the three and six months ended June 30, 2026 was $1.37 billion and $2.71 billion, respectively.
THE CHECK	wrong quarter: the period ended in June, the claim says Q3 2026 → −25 USDG (test USDG)
AGENTDESK	a trade citing it: reverted, naming the claim. The journal records why the agent traded what it did instead.

Where it ran: Robinhood Chain testnet, 24 Sep, settled by one verifier key (v1) · the same words on a local devnet, settled by the CRE workflow's own code in Chainlink's SDK test runtime (14 Oct) · a CRE CLI simulation on testnet: pending.

THE LEGAL GAP

Research rules assume a person. AI drafts research now, and cannot certify a belief.

REGULATION AC · 17 CFR 242.501(A)(1)

a certification "attesting that all of the views expressed in the research report accurately reflect the research analyst's personal views". The analyst: "any natural person..." (242.500)

FINRA RULE 2241(C)(1)(A)

procedures "reasonably designed to ensure that purported facts in its research reports are based on reliable information"

FINRA REGULATORY NOTICE 24-09

FINRA's rules "are intended to be technology neutral" and "continue to apply when member firms use Gen AI"

FINRA 2026 OVERSIGHT REPORT · AI AGENTS

consider "how to track agent actions and decisions; or how to establish guardrails"

Courts already know the failure: 1,116 US court filings with AI-fabricated content, 1,600 worldwide (Charlotin database, reported by AFP, June 2026).

HOW IT WORKS

A record of what was said, what the filing says, and what was done about it.

01

Stake

An analyst, human or AI, posts one figure, the 10-Q sentence behind it and a USDG stake. The exact words go on-chain.

02

Check

A Chainlink CRE workflow fetches the filing from SEC EDGAR and runs the check (on a DON, on every node). The contract has no verifier key.

03

Pay

Wrong: the stake goes to a readers' fund fixed at deploy, in the same transaction as the verdict; each payee withdraws its share (`claimReaderShare`). Right: it comes back.

04

Gate

A trading agent cannot cite research that failed. The trade reverts, naming the claim.

05

Journal

Each trade keeps the claims it cites, the verdict on each and the agent's reasoning; the record's hash is on-chain.

CHAINLINK RUNTIME ENVIRONMENT

The check is a Chainlink CRE workflow. The contract has no verifier key.

Posted event → EVM log trigger → HTTP: SEC EDGAR (gzip, ~100 KB) → the check (on a DON, on every node) → identical consensus → report → **forwarder** → **BondedClaims.onReport**: owner, name, pinned workflow id, claim hash

3,249

claims on five real 10-Qs: same verdict, reason and score as the Python check, on Bun and on QuickJS (the engine CRE runs)

50/50

verdicts in a local round built by the workflow's own handler in Chainlink's SDK test runtime, each matching the Python check

0

verifier keys in the contract. On a DON only signed reports land; one compiled workflow id can be pinned, forever

Run: WASM build (cre workflow build), the SDK test runtime, QuickJS parity. **Not yet:** the CRE CLI simulation on testnet (pending login), a DON. In simulation, Chainlink's mock forwarder takes anyone's report.

Every trade keeps its reasons. Re-verify redoes them in the browser.

LONG **TSLA** Tesla 100 USD paper · cites 3 cleared claims · 7 refusals — entry #0

01 **Read.** 10 claims about Tesla from 5 analysts, each citing Tesla's 10-Q.

02 **Refused.** It tried to trade citing everything it read. The desk asked Vouch about each claim and reverted the trade 7 times, each time naming a claim that failed the check:

- #2 Misreader claims another number — refused on-chain 0xc4b333…2f3f
- #3 Embellisher a figure was changed — refused on-chain 0xfda1fa…20a3
- #4 Fabricator not in the filing — refused on-chain 0xb2187f…c458
- #6 Qwen 2.5 7B wrong quarter — refused on-chain 0xd28afd…a3e9
- #7 Misreader claims another number — refused on-chain 0xaf4a14…acec
- #8 Embellisher a figure was changed — refused on-chain 0x09bc67…55b3
- #9 Fabricator not in the filing — refused on-chain 0xd37e9f…f166

03 **Kept what held.** The desk accepted every one of these: each cleared the check.

CLAIM	ANALYST	WHAT IT SAYS	VERDICT	READ AS
#0	Diligent	**$8.28 billion** Capital expenditures amounted to $8.28 billion during the six months ended June 30, 2026, compared to …	CLEARED verdict 0xe4e5e8…18ee	**no signal** no signal: neither revenue-like nor cost-like
#1	Qwen 2.5 7B	**$8.63 billion** Operating cash flows increased to $8.63 billion in the first half of		**bullish**

News Checker (RYO): the same agent reads posts by market voices, finds each figure in the 10-Q and checks the story as a staked claim. A loud post with the wrong quarter moves nothing. Demo posts: 20, written fixtures by fictional accounts. **Decisions:** fixed rules by default (re-run in the browser); optionally a model behind an OpenAI-compatible endpoint, its exact reply hashed into the record (tested, not used in the demo round).

FOR LAWYERS

What the record proves, and what it does not.

IT PROVES

- the exact words of each claim, who staked on them, when
- which filing bytes the verdict was checked against, and by which workflow
- that a trade cited only claims that had cleared
- that its stated reasons were fixed when it was made

IT DOES NOT PROVE

- that a view was honestly held (Reg AC's certification)
- a reasonable basis for a rating or target (2241(c)(1)(B))
- that the filing is true, or the claim complete
- who is behind a wallet, or Rule 17a-4 compliance

WHO USES IT

Evidence for the people who answer for research.

Compliance

Publish only cleared

A firm distributing AI-drafted or third-party research keeps the check's record for each fact: evidence of its 2241(c)(1)(A) procedures.

Publishers

Show the work

A newsletter that drafts with AI shows, per claim, that the numbers were checked, with a stake behind them.

Agent operators

Guardrail and trace

The desk is the guardrail, the journal the trace: the two things FINRA's 2026 report asks about AI agents.

Examiners, courts

Re-run it

An independent record of what was said, what the source said and what was done, that anyone can redo.

PROOF IT WORKS

Tested end to end, on real SEC filings.

57

Foundry tests: forwarder-only verdicts, the readers' fund payout (double claim, rounding, re-entry), forged workflow refused, money conserved through fuzzed disputes, unchecked claims refused by the desk, claims sized for CRE's log limit

87

Python and Bun tests: rounds on a real EVM, the agent's model path against a fake server, the journal re-verified and tamper-checked, the CRE handler in the SDK's test runtime, the KOL mode, the round script's failure handling

87/87

journal checks hold in the local round: nothing left out, record hashes, claim words, verdict transactions, filing bytes from EDGAR, a fresh check, the agent's rules re-run

TRUST, STATED PLAINLY

What is trusted today, and what is next.

TODAY

- Simulation writes through Chainlink's mock forwarder: anyone can settle there. It proves the path, not the security
- The filing is what SEC EDGAR serves; its hash (less the CDN's script tag) is on-chain
- The check says what it cannot do: a limit versus a balance
- On the test market the deployer stands in for the readers' fund; who it is in production is a legal choice

NEXT

- A live DON, the KeystoneForwarder, a pinned workflow id (after SEC's User-Agent rule is solved)
- Robinhood Chain mainnet, bonded in USDG
- 8-Ks and 10-Ks; one compliance team piloting cleared-only publication

If it's wrong, it costs you. If you trade on it, the record shows why.
